

## AGiTeC

### Focus

The working group for intraoperative imaging and technology integration (AGiTEC) is dedicated to initiating and promoting the conception and development of innovative technologies and computer-assisted surgical procedures, as well as to accompanying and advising the transfer into clinical practice.

Furthermore, AGiTEC is the ideal contact for patients, surgeons, industry and organisations with questions in the fields of intraoperative imaging, image-guided surgery, navigation, hybrid surgery, operation planning and robotics. Aside from the aforementioned goals, the focus is also on innovative surgical procedures with CAD-milled individual incision templates or individually manufactured implants, for example in the field of endoprosthetics or revision surgery.

In addition, the working group establishes a training and further educational programs for the topics mentioned, both within the course of workshops and through fellowships with experienced users.
